

AdSpot Hostile Audit Report

Date: 22 July 2026

Verdict: WARN - 0 hard fail(s), 3 warning(s)

BUILD

- PASS pnpm install
- PASS pnpm typecheck
- PASS pnpm test - 33 tests passed
- PASS pnpm build

SCORING

- PASS review-scoring unit tests - passed

LOCAL

- PASS server boot - port 3199
- PASS SPA / - 200
- PASS SPA /earn - 200
- PASS SPA /earn/login - 200
- PASS SPA /earn/register - 200
- PASS SPA /earn/dashboard - 200
- PASS SPA /earn/leaderboard - 200
- PASS SPA /brands - 200
- PASS SPA /brands/login - 200
- PASS SPA /brands/dashboard - 200
- PASS API GET /api/healthz - status=503
- WARN DATABASE_URL configured - DATABASE_URL is unset or still contains template placeholders (HOST/USER/PASSWORD). Copy server/.env.example -> server/.env and set a real Postgres URL.
- PASS API GET /api/public/stats - status=503
- PASS API GET /api/public/videos - status=503
- PASS API GET /api/public/packages - status=503
- PASS API POST /api/auth/login - status=503
- SKIP auth smoke - database not connected - run seed:accounts after configuring DATABASE_URL

LIVE

- WARN https://adspot.ng - unreachable - deploy not live or DNS blocked
- WARN https://api.adspot.ng/api/healthz - unreachable

LOCAL vs LIVE

- LOCAL - build, test, boot, and route checks on this machine (authoritative for code quality).
- LIVE - best-effort against deployed URLs; WARN if unreachable (not a code failure).
- Auth smoke - runs only when /api/healthz reports db: connected.

Required before production PASS

1. Set real `DATABASE\_URL` in `server/.env` (not HOST/USER placeholders).
2. Run `pnpm --filter @workspace/db run push` then `seed:accounts` on Postgres.
3. Set `JWT\_SECRET` to a random 64+ char string.
4. Deploy unified server (`pnpm build && pnpm start`) or split SPA + API per README.
