

AdSpot - Staging Deployment Guide

Prerequisites

- Node.js 20+
- pnpm 9 (corepack enable && corepack prepare pnpm@9 --activate)
- PostgreSQL 14+ (RDS, Supabase, or local)

1. Configure environment

```
cp server/.env.example server/.env
```

Edit server/.env:

Variable	Required	Notes
PORT	yes	Default 3001
DATABASE_URL	yes	Real Postgres URL - not HOST/USER placeholders
JWT_SECRET	yes	openssl rand -hex 64
STATIC_DIR	yes (unified)	./app/dist
AI_INTEGRATIONS_OPENAI_*	optional	Only for brand AI features (lazy-loaded; server boots without valid keys)
CORS_ORIGINS	split deploy only	Comma-separated frontend origins

2. Build and verify locally

```
npx pnpm@9 install
npx pnpm@9 run typecheck
npx pnpm@9 run test
npx pnpm@9 run build
node scripts/hostile-audit.mjs # must exit 0 (PASS or WARN) before staging
```

Expected audit verdict without a live DB: **WARN** (code passes; configure Postgres for **PASS** with auth smoke).

3. Database setup

```
npx pnpm@9 --filter @workspace/db run push
npx pnpm@9 --filter @workspace/db run seed
npx pnpm@9 --filter @workspace/db run seed:accounts # demo logins (reviewer, brand, admin)
npx pnpm@9 --filter @workspace/db run seed:settings
```

/api/healthz must return HTTP 200 with "status":"ok" and "db":"connected".

4. Login credentials & portals

All demo accounts use password password123 (change super-admin on first real deploy).

Reviewer (earn points by watching ads)

Field	Value
Portal URL	http://localhost:3001/earn/login

Register	http://localhost:3001/earn/register
Email	alice@reviewer.demo (or bob@reviewer.demo ... jack@reviewer.demo)
Password	password123

Flow: Register -> profile step (optional skip) -> /earn/dashboard -> pick an ad -> watch + answer questions -> earn points.

Use the Earn portal (/earn/login), not the Brand portal. Brand/admin accounts are rejected on reviewer login with a “Wrong portal” message.

Brand (create campaigns, set questions, view analytics)

Field	Value
Portal URL	http://localhost:3001/brands/login
Register	http://localhost:3001/brands/register
Email	mtn@adspot.demo (or any *@adspot.demo brand from seed)
Password	password123

Flow: Login -> /brands/dashboard (overview metrics) -> Ads -> create campaign with questions -> publish -> view per-ad stats and survey positivity scores.

Admin (manage users, campaigns, payouts)

Field	Value
Portal URL	http://localhost:3001/brands/login (same login as brand)
Email	admin@adspot.demo
Password	password123

Flow: Login -> auto-redirect to /brands/admin/dashboard -> users, ads, events, financials.

Super admin

Email	oadeagbo@gmail.com
Password	password123
Portal	/brands/login -> admin console

5. Unified deploy (recommended)

One Node process serves SPA + API on the same origin:

```
pnpm start
# -> http://localhost:3001
```

AWS options: App Runner, Elastic Beanstalk, or ECS/Fargate running node server/dist/index.mjs with env vars above.

6. Split deploy (SPA on S3/CloudFront + API elsewhere)

```
VITE_API_BASE_URL=https://api.yourdomain.com npx pnpm@9 run build
# Deploy app/dist to S3+CloudFront (403/404 -> /index.html)
# Deploy server to App Runner/ECS
# Set CORS_ORIGINS=https://your-frontend-domain.com on API
```

7. Post-deploy checks

```
ADSPOT_LIVE_URL=https://your-domain.com ADSPOT_LIVE_API_URL=https://api.your-domain.com node
scripts/hostile-audit.mjs
```

With DB connected locally, hostile audit also runs auth smoke: reviewer/brand/admin login, /api/auth/me, admin stats, brand analytics, and reviewer registration.

Common failures

Symptom	Cause	Fix
/api/healthz 503, db: misconfigured	Placeholder DATABASE_URL	Set real Postgres URL
/api/public/* 503	DB unreachable	Check RDS security group, credentials
Login 503	DATABASE_URL placeholder or Postgres down	Set real DATABASE_URL, run seed:accounts, restart server
Login shows "Invalid email or password" but API is 503	DB not configured	Fix DATABASE_URL first (not a credentials issue)
Reviewer login "Wrong portal"	Brand/admin email used on /earn/login	Use /brands/login for brand/admin accounts
Reviewer login 401	Seed not run or wrong password	Run seed:accounts; use alice@reviewer.demo / password123
Reviewer signup skips profile	Fixed - register saves token via establishSession	Rebuild app if on old bundle
adspot.ng 403/000	Not deployed	Point DNS to your host, deploy app
Build passes, app blank	STATIC_DIR unset	Set STATIC_DIR=./app/dist

Package contents

This zip includes source, docs/HOSTILE_AUDIT_REPORT.md, and this guide. Re-run `npx pnpm@9 install` on the target host.
